Please amend the Abstract as presented in the underlying International Application No. PCT/EP2004/010800 as follows:

ABSTRACT

~~The invention relates to a~~ A method and a device for performing inter-vehicle distance control on a vehicle, an actual value ( $d_{act}$ ) of a distance variable which describes a distance between the vehicle and a vehicle traveling in front being determined, is provided. ~~Furthermore, a~~ A plurality of weighting values ( $g_i$ ) for the distance variable are determined as a function of input variables ( $x_i$ ) which describe the driving situation of the vehicle and/or the ambient situation of the vehicle and/or the driving behavior of the driver. From the weighting values in turn a set point value ( $d_{setp}$ ) for the distance variable is determined, a braking device means and/or driving device means of the vehicle being actuated in such a way that the determined actual value ( $d_{act}$ ) of the distance variable assumes the determined set point value ( $d_{setp}$ ). ~~According to the invention, in~~ In order to determine the set point value ( $d_{setp}$ ) of the distance variable the weighting values ( $g_i$ ) are multiplied by one another.
